Northeastern University, Fall 2021

PROBLEM SET 1, DUE: OCT 16, 2019

Problem	\mathbf{Set}	Ru	$\mathbf{les}:$
---------	----------------	----	-----------------

- 1. Each student should hand in an individual problem set at the beginning of class.
- 2. Discussing problem sets with other students is permitted. Copying from another person or solution set is not permitted.
- 3. Late assignments will not be accepted. No exceptions.

1.	. (Total: 15 points)
	This exercise involves the Auto data set. Make sure that the missing values have been removed from the data.
	(a) (2 points) Which of the predictors are quantitative, and which are qualitative?
	(b) (2 points) What is the range (e.g., minimum and maximum) of each quantitative predictor?

(f) (3 points) Suppose that we wish to predict gas mileage (mpg) on the basis of the other variables. Do your plots suggest that any of the other variables might be useful in predicting mpg? Justify your answer.

- 2. (Total: 20 points) This exercise involves the Boston housing data set.
 - (a) (2 points) How many rows are in this data set? How many columns? What do the rows and columns represent?

Northeastern University, 6105	Name:
(b) (3 points) Make some pairwise scatterplots of the predict your findings.	tors (columns) in this data set. Describe

theastern University, 6105	Name:	

(c) (2 points) Are any of the predictors associated with per capita crime rate? If so, explain the

lationship.	

(d) (3 points) Do any of the suburbs of Boston appear to have particularly high crime rates? Tax rates? Pupil-teacher ratios? Comment on the range of each predictor.

5. (Total: 14 points)

This problem involves the Boston data set. We want to predict per capita crime rate using the other variables in this data set. In other words, per capita crime rate is the response, and the other variables are the predictors.

(a) (3 points) For each predictor, fit a simple linear regression model to predict the response. Describe your results. In which of the models is there a statistically significant association between the predictor and the response? Create some plots to back up your assertions.

Name:

Northeastern University, 6105

from (b) coefficient	mivariate regression coefficients from (a) on the x -axis, and the multiple regression coefficients (b) on the y -axis. That is, each predictor is displayed as a single point in the plot. Its identification in a simple linear regression model is shown on the x -axis, and its coefficient estimate in multiple linear regression model is shown on the y -axis.					

$y = \beta_0 + \beta_0$	$\beta_1 x + \beta_2 x^2 + \beta_3 x^3 + \epsilon$

(d) (4 points) Is there evidence of non-linear association between any of the predictors and the re-

sponse? To answer this question, for each predictor x, fit a model of the form
